CERTIFICATE OF COMPLETION

This is to certify that the work entitled, “**LOCATION ANALYSER**” is the bonafied work of **B.Mounika** with ID No: **N160672** and **Shameena Sultana** with ID No: **N160562** and **K.Kalyani** with ID No: **N161182** and **S.Parvathi** with ID No: **N160653** and **S.Jaswani Devi** with ID No: **N160666** and **G.Vijay Kumar** with ID No: **N160413** carried out under my guidance and supervision for the partial fulfillment of the requirement for the award of the degree of Bachelor of Technology in the department of Computer Science and Engineering in RGUKT Nuzvid. This work is done during the academic session December 2020 – May 2021, under my guidance.

ACKNOWLEDGEMENT

We would like to expose our profound gratitude and deep regards to my guide

Mr.R. Upendar Rao for his exemplary guidance, monitoring and constant encouragement throughout the course of this thesis.

We are extremely grateful for the confidence bestowed in us and entrusting our project entitled “**Location Analyser**”.

At this juncture we feel deeply honored in expressing our sincere thanks to him for making the resources available at right time and providing valuable insights leading to the successful completion of our project.

We would like to thank RGUKT Nuzvid Director, faculty and staff for their valuable suggestions and discussions.

Last but not least I thank almighty, and I place a deep sense of gratitude to my family members and my friends who have been constant source of information during the preparation of this project work.

Abstract

We propose a location analyser which analyse the neighbourhoods of the location and recommend the best location for the stakeholders, entrepreneurs etc. The proposed system overcomes the disadvantage of traditional searching system all over the city. The main aim of developing this project is to minimize the searching time of the stakeholders for searching the best location. For the better accuracy we take the data from well organized and secured websites like Foursquare API.

1. Problem statement:

Design and implement the location analyser system which aims for less searching time for the stakeholders for the best locations for startups like opening a restaurant.

2. Analysis of Existing Systems

Until now there is no proper recommendation systems which recommends the best location for the start-ups. All the stakeholders are needed to search all over the city and take several others opinions to start a restaurant at some locations, sometimes it may be a better location and restaurant will be in profits and sometimes it may not. So our aim is to implement a better location analysis and recommendation system.

3. Requirements

3.1 SOFTWARE REQUIREMENTS

1. Python idle(2.7 or more)
2. anaconda for jupyter notebook(version 1.7.2 or above)

3.2 HARDWARE REQUIREMENTS

1. Processer: I3 or more
2. Os : Windows
3. Ram : 4GB or more
4. Hard drive: 50gb

3.3 Technologies:

Pip(version 20.0.2):

As our project is a machine learning project we need many python libraries for data collection, preprocessing and modelling the data and for applying machine learning algorithms

The libraries that are needed for our project:

- 1.numpy
- 2.pandas
- 3.matplotlib
- 4.seaborn
- 5.sklearn
- 6.Geopy
- 7.geocoder
- 8.folium

Type of users/Actors

1. Data analyser
2. stakeholder

Data Analyser Features

1. installing and importing libraries
2. data collection
3. data cleaning
4. data preprocessing
5. applying machine learning algorithm
6. finding best location

Stackholder Feature

1. knowing the location
2. knowing what to setup in that location

4.Data Collection

The following data is required for the project:

- 1) Neighbourhood data of Mumbai
- 2) Geographical coordinates of Mumbai and all neighbourhoods in Mumbai
- 3) Venue data for neighbourhoods in Mumbai

4.1 Neighbourhoods Data

The data of the neighbourhoods in Mumbai was scraped from https://en.wikipedia.org/wiki/List_of_neighbourhoods_in_Mumbai. The data is read into a pandas data frame using the read_html() method. The main reason for doing so is that the Wikipedia page provides a comprehensive and detailed table of the data which can easily be scraped using the read_html() method of pandas. The top 10 rows of the dataframe are shown in Figure 1.

	Neighborhood	Location	Latitude	Longitude
0	Amboli	Andheri,Western Suburbs	19.129300	72.843400
1	Chakala, Andheri	Western Suburbs	19.111388	72.860833
2	D.N. Nagar	Andheri,Western Suburbs	19.124085	72.831373
3	Four Bungalows	Andheri,Western Suburbs	19.124714	72.827210
4	Lokhandwala	Andheri,Western Suburbs	19.130815	72.829270
5	Marol	Andheri,Western Suburbs	19.119219	72.882743
6	Sahar	Andheri,Western Suburbs	19.098889	72.867222
7	Seven Bungalows	Andheri,Western Suburbs	19.129052	72.817018
8	Versova	Andheri,Western Suburbs	19.120000	72.820000
9	Mira Road	Mira-Bhayandar,Western Suburbs	19.284167	72.871111

Figure 1: Top 10 rows of Mumbai neighbourhoods data scraped from Wikipedia.

4.2 Geographical Coordinates

The geographical coordinates for Mumbai has been obtained from the GeoPy library in python. This data is relevant for plotting the map of Mumbai using the Folium library in python. The code for getting the geographical coordinates of Mumbai is shown in Figure 2.

```
address = 'Mumbai, IN'
geolocator = Nominatim()
location = geolocator.geocode(address)
latitude = location.latitude
longitude = location.longitude
print('The geograpical coordinates of Mumbai are {}, {}'.format(latitude, longitude))
```

The geograpical coordinates of Mumbai are 19.0759899, 72.8773928.

Figure 2: Obtaining geographical coordinates of Mumbai.

The geocoder library in python has been used to obtain latitude and longitude data for various neighbourhoods in Mumbai. The coordinates of all neighbourhoods in Mumbai are used to check the accuracy of coordinates given on Wikipedia and replace them in our data frame if the absolute difference is more than 0.001. These refined coordinates are then further used for plotting neighbourhoods using the Folium library in python. Figure 3 shows the coordinates of neighbourhoods in Mumbai obtained from Wikipedia as 'Latitude' and 'Longitude' and those

obtained from geocoder as ‘Latitude1’ and ‘Longitude1’. Furthermore, it also shows the absolute difference between the two latitude columns and the two longitude columns as ‘Latdiff’ and ‘Longdiff’, respectively. Once again only the top 10 rows are shown.

	Neighborhood	Location	Latitude	Longitude	Latitude1	Longitude1	Latdiff	Longdiff
0	Amboli	Western Suburbs	19.1293	72.8464	19.1291	72.8464	0.00024	0.00304
1	Chakala, Andheri	Western Suburbs	19.1084	72.8623	19.1084	72.8623	0.003028	0.001497
2	D.N. Nagar	Western Suburbs	19.1241	72.8325	19.1251	72.8325	0.000965	0.001107
3	Four Bungalows	Western Suburbs	19.1263	72.8243	19.1263	72.8243	0.001606	0.00288
4	Lokhandwala	Western Suburbs	19.1432	72.8249	19.1432	72.8249	0.012345	0.0044
5	Marol	Western Suburbs	19.1192	72.8827	19.1191	72.8828	0.000169	6.7e-05
6	Sahar	Western Suburbs	19.1027	72.8626	19.1027	72.8626	0.00376476	0.00464166
7	Seven Bungalows	Western Suburbs	19.1315	72.817	19.1315	72.8165	0.00240802	0.000558001
8	Versova	Western Suburbs	19.1377	72.8135	19.1377	72.8135	0.01769	0.00652
9	Mira Road	Western Suburbs	19.2657	72.8711	19.2657	72.8707	0.0184624	0.000418149

Figure 3: Absolute difference between latitude and longitude values obtained from Wikipedia and Geocoder.

Figure 4 shows the top 10 rows of the final Mumbai neighbourhoods dataframe after replacing the latitude and longitude values as mentioned before and dropping unnecessary columns.

	Neighborhood	Location	Latitude	Longitude
0	Amboli	Western Suburbs	19.1293	72.8464
1	Chakala, Andheri	Western Suburbs	19.1084	72.8623
2	D.N. Nagar	Western Suburbs	19.1241	72.8325
3	Four Bungalows	Western Suburbs	19.1263	72.8243
4	Lokhandwala	Western Suburbs	19.1432	72.8249
5	Marol	Western Suburbs	19.1192	72.8827
6	Sahar	Western Suburbs	19.1027	72.8626
7	Seven Bungalows	Western Suburbs	19.1315	72.817
8	Versova	Western Suburbs	19.1377	72.8135
9	Mira Road	Western Suburbs	19.2657	72.8711

Figure 4: Final Mumbai neighbourhoods dataframe.

4.3 Venue Data

The venue data has been extracted using the Foursquare API. This data contains venue recommendations for all neighbourhoods in Mumbai and is used to study the popular venues of different neighbourhoods as well as build the unsupervised learning model to cluster neighbourhoods. The venue recommendations of all neighbourhoods were obtained with a limit of 200, that is, maximum of 200 venue recommendations per neighbourhood and a radius of 1 km around the neighbourhood's geographical coordinates. Figure 5 shows the top 10 rows depicting the results obtained after cleaning the data from Foursquare API.

	Neighborhood	Neighborhood Latitude	Neighborhood Longitude	Venue	Venue Latitude	Venue Longitude	Venue Category
0	Amboli	19.1293	72.84644	Cafe Arfa	19.128930	72.847140	Indian Restaurant
1	Amboli	19.1293	72.84644	5 Spice , Bandra	19.130421	72.847206	Chinese Restaurant
2	Amboli	19.1293	72.84644	Shawarma Factory	19.124591	72.840398	Falafel Restaurant
3	Amboli	19.1293	72.84644	Jaffer Bhai's Delhi Darbar	19.137714	72.845909	Mughlai Restaurant
4	Amboli	19.1293	72.84644	Narayan Sandwich	19.121398	72.850270	Sandwich Place
5	Amboli	19.1293	72.84644	Persia Darbar	19.136952	72.846822	Indian Restaurant
6	Amboli	19.1293	72.84644	Domino's Pizza	19.131000	72.848000	Pizza Place
7	Amboli	19.1293	72.84644	Garden Court	19.127188	72.837478	Indian Restaurant
8	Amboli	19.1293	72.84644	Subway	19.127860	72.844461	Sandwich Place
9	Amboli	19.1293	72.84644	Sarvodaya Veg. Restaurant	19.123760	72.850893	Indian Restaurant

5. METHODOLOGY:

This section provides details for the methodology used in the project.

5.1 Data Visualization

In order to understand the data obtained for Mumbai neighbourhoods, basic visualization was carried out. Figure 6 shows a bar plot depicting the number of neighbourhoods in each location in Mumbai.

Figure 6: Number of neighbourhoods grouped by location.

It is evident from Figure 6 that South Mumbai and Western Suburbs have the most number of neighbourhoods. Notice how we see one of the locations as Mumbai itself? This is because the neighbourhoods contained in this location are located at the outskirts of the city and thus have been termed as just Mumbai.

Using folium, a map was plotted to show how the different neighbourhoods are spread all across Mumbai. This is shown in Figure 7.

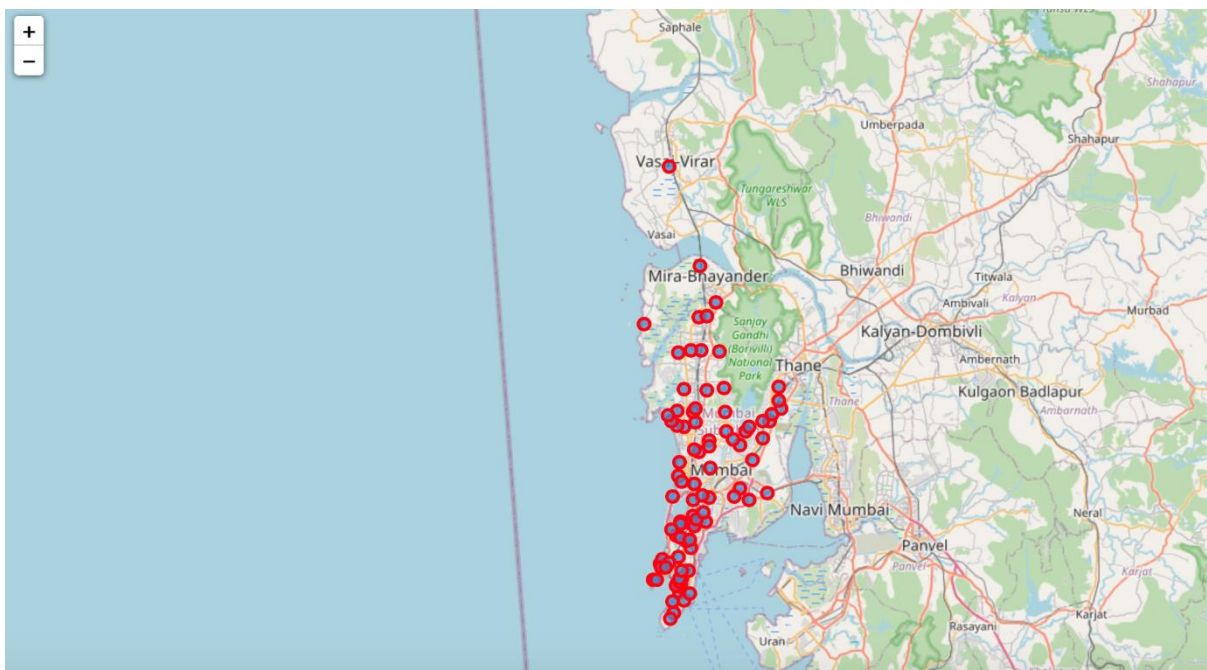

Figure 7: Depicting the neighbourhood spread across Mumbai.

5.2 Feature Extraction

Feature extraction was carried out to obtain features from the Foursquare API data (as shown in Figure 5) which was used for building the unsupervised learning model. In order to achieve this, the “Venue Category” column had to be converted to some form of numeric value to be used for building the model. This was achieved by the One-hot Encoding method which takes all the unique categories and creates a column for each category. Then, if a neighbourhood venue belongs to that category, it would get a value of 1 for that row in that specific category column and if a neighbourhood venue does not belong to the particular category, the value would be 0. This process was repeated for all venues in all neighbourhoods and the result was a sparse matrix containing the neighbourhood name and all unique category columns with either 1 or 0 based on whether the neighbourhood venue belonged to that category or not. This dataframe was then grouped by the neighbourhood name and the average value was taken for all categories. The result is shown in Figure 8 which shows only the top 10 rows.

	Neighborhood	ATM	Accessories Store	Airport Terminal	American Restaurant	Antique Shop	Aquarium	Arcade	Art Gallery	Arts & Crafts Store	...	Trail	Train	Train Station	Vegetarian / Vegan Restaurant	Whisky Bar	Wine Bar	Wine Shop	Women's Store	Yoga Studio	Zoo

10 rows x 221 columns

Figure 8: One-hot Encoding resulting dataframe.

Notice that most of the values are 0 since there were a large number of unique categories and not all neighbourhoods had venues belonging to each category. This data was used for the unsupervised learning model with the neighbourhood name dropped. The unsupervised learning model is explained in the next section.

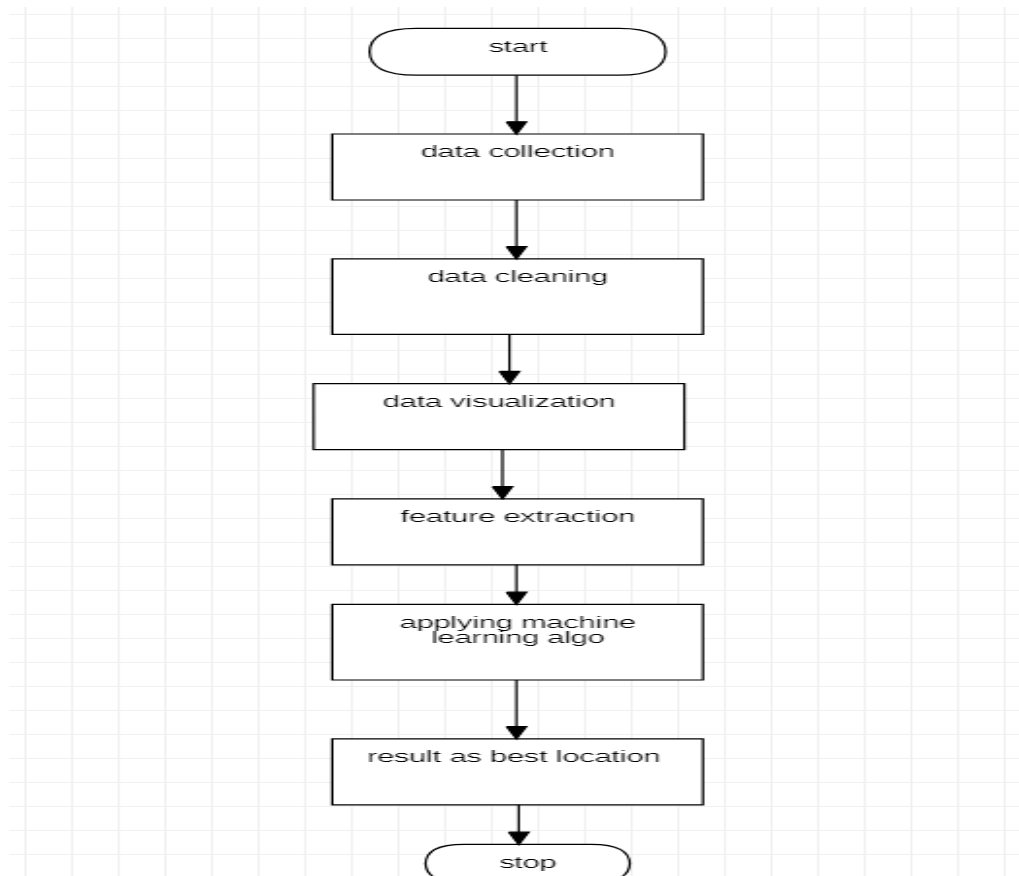

A dataframe was also created which contained the top 10 most common venues of all neighbourhoods. Though this is not a part of Feature Extraction, it is important to provide a glimpse into what this dataframe looks like as it will be used later to combine the results from the unsupervised learning model. The top 10 rows of this dataframe are shown in Figure 9.

	Neighborhood	1st Most Common Venue	2nd Most Common Venue	3rd Most Common Venue	4th Most Common Venue	5th Most Common Venue	6th Most Common Venue	7th Most Common Venue	8th Most Common Venue	9th Most Common Venue	10th Most Common Venue
0	Amboli	Indian Restaurant	Coffee Shop	Bakery	Bar	Asian Restaurant	Pizza Place	Sandwich Place	Bowling Alley	Bus Station	Bike Rental / Bike Share
1	Chakala, Andheri	Hotel	Indian Restaurant	Café	Fast Food Restaurant	Pizza Place	Asian Restaurant	Hotel Bar	Vegetarian / Vegan Restaurant	Restaurant	Gym
2	D.N. Nagar	Bar	Indian Restaurant	Pub	Gym / Fitness Center	Pizza Place	Lounge	Coffee Shop	Vegetarian / Vegan Restaurant	Snack Place	Gym

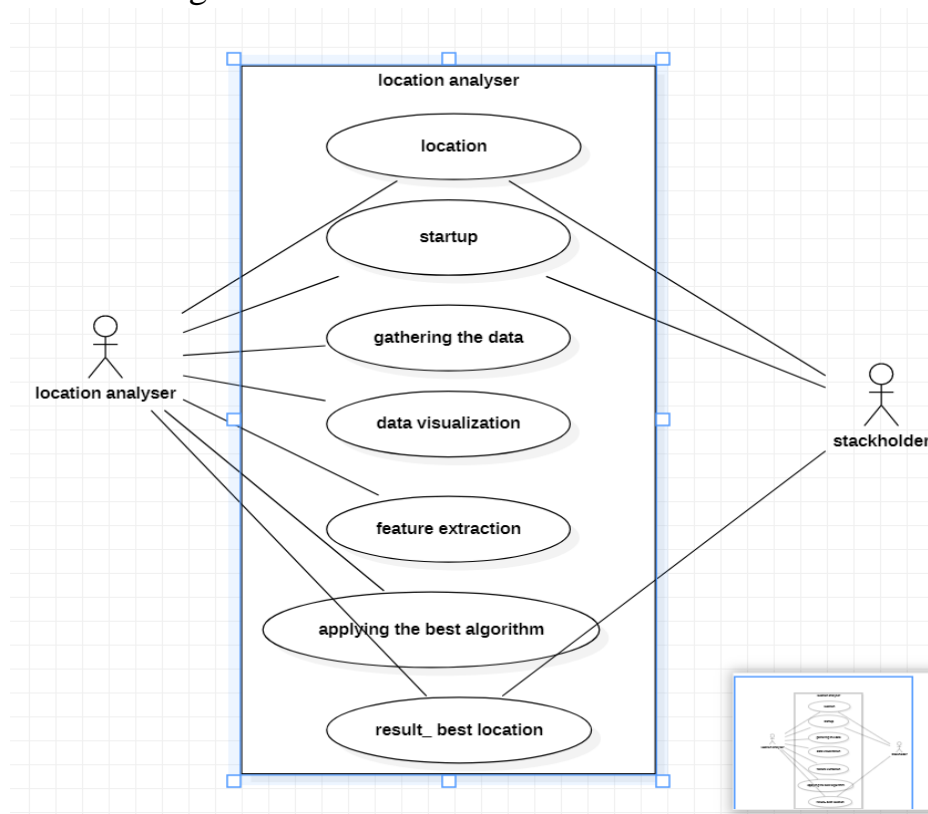

Figure 9: Top 10 most common venues for neighbourhoods.

6.SYSTEM DESIGN:

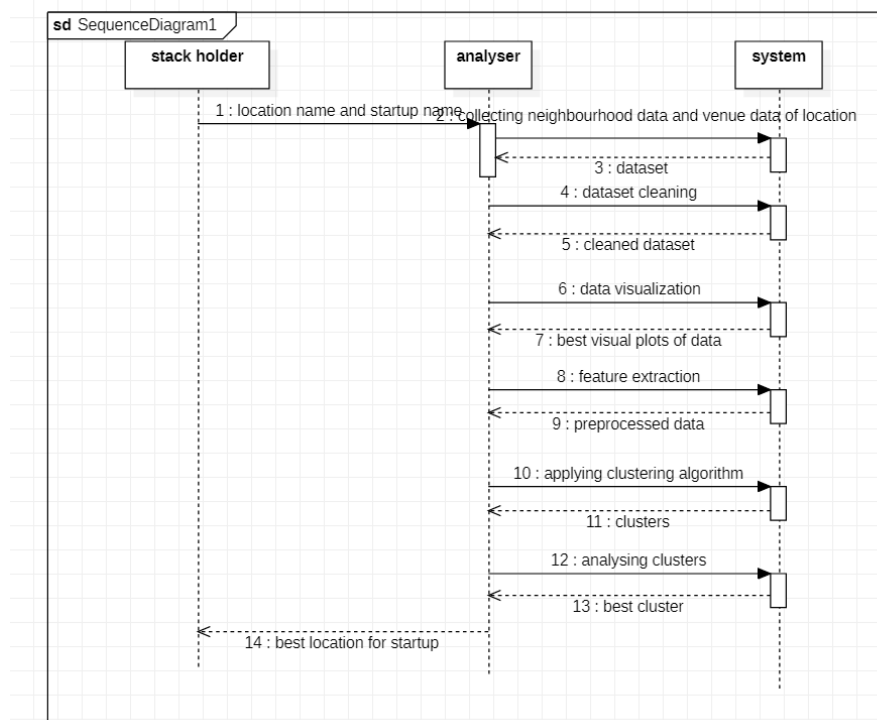

6.1: Flow chart

6.2 use case diagram

6.3 sequence diagram

7. Unsupervised learning:

K-means unsupervised learning technique was used to cluster the neighbourhoods based on the category of venues near the neighbourhoods. One important aspect of the k-means model is to determine the number of clusters to use in model development. This was determined by the Silhouette score which was calculated for a range of clusters from 2 to 15. The resulting number of clusters and their respective Silhouette scores are shown in Figure 10.

Figure 10: Silhouette scores for different number of clusters.

It is evident that the Silhouette scores are not very high even as the number of clusters increases. This means that the inter-cluster distance is not very high over the range of k-values. Despite this, the data will be clustered to the best possible extent. For this, 5 clusters will be used for the k-means clustering model since it provides the highest silhouette score as seen in Figure 10.

8.Result:

The clustering model then clusters the neighbourhoods in Mumbai and provides a label for each neighbourhood which is representative of the cluster it belongs to. The cluster labels were then added to the dataframe in Figure 9 along with the Location, Latitude, and Longitude columns to provide a complete summary of the clustering. The top 10 rows are shown in Figure 11.

	Neighborhood	Location	Latitude	Longitude	Cluster Labels	1st Most Common Venue	2nd Most Common Venue	3rd Most Common Venue	4th Most Common Venue	5th Most Common Venue	6th Most Common Venue	7th Most Common Venue	8th Most Common Venue	9th Most Common Venue	10th Most Common Venue

Figure 11: Clustering neighbourhoods in Mumbai.

Furthermore, neighbourhoods in each individual cluster can be extracted using cluster labels and thus the details of specific clusters can be seen. This is done below for all clusters with only 10 rows for clusters that contain a high number of neighbourhoods.

	Neighborhood	Location	1st Most Common Venue	2nd Most Common Venue	3rd Most Common Venue	4th Most Common Venue	5th Most Common Venue	6th Most Common Venue	7th Most Common Venue	8th Most Common Venue	9th Most Common Venue	10th Most Common Venue
36	Bhandup	Eastern Suburbs	Train Station	Indian Restaurant	Fast Food Restaurant	Asian Restaurant	Zoo	Donut Shop	Flea Market	Fish Market	Fish & Chips Shop	Field
40	Kanjurmarg	Eastern Suburbs	Train Station	Gift Shop	Gym	Multiplex	Asian Restaurant	Chinese Restaurant	Cupcake Shop	Hotel	Field	Fast Food Restaurant
90	Dava Bazaar	South Mumbai	Train Station	Indian Restaurant	Cupcake Shop	Hotel	Fish Market	Café	Fast Food Restaurant	Coffee Shop	Asian Restaurant	Smoke Shop

Figure 16: Cluster 5.

Based on the clusters shown above, the neighbourhoods can once again be plotted on a map of Mumbai, however, this time with different colour markers to distinguish between different clusters. This is shown in Figure 17.

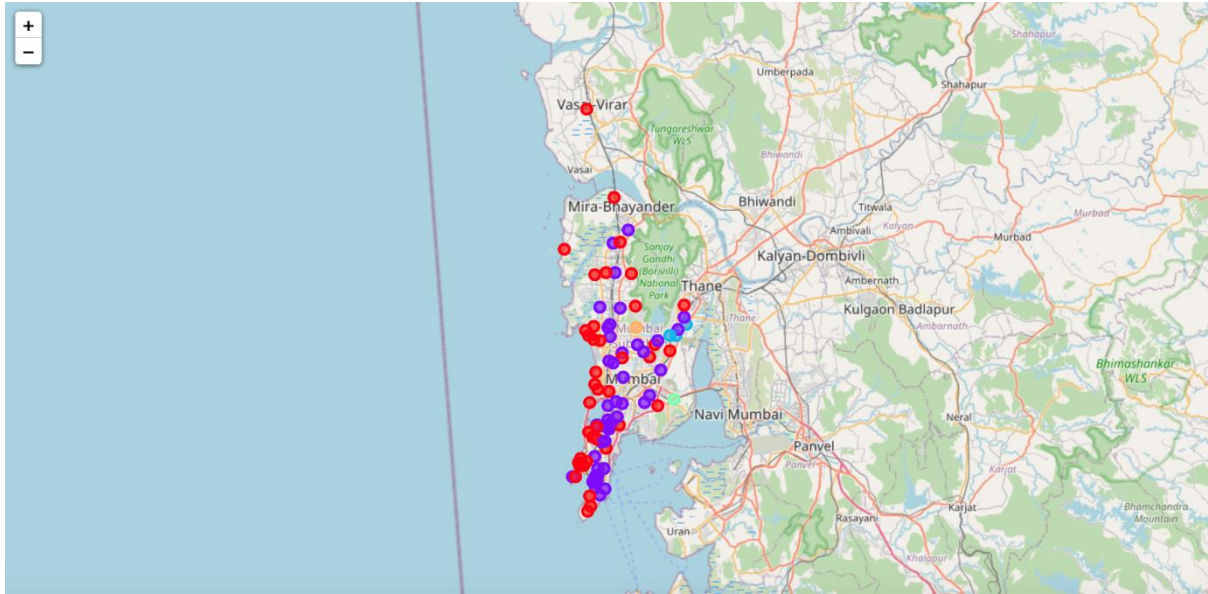

Figure 17: Visualizing the clustering of neighbourhoods in Mumbai.

9. Discussion

By analyzing the five clusters obtained we can see that some of the clusters are more suited for restaurants and hotels, whereas, other clusters are less suited. Neighbourhoods in clusters 1, 2 and 5 contain a small percentage of restaurants, hotels, cafe and pubs in their top 10 common venues. These clusters contain a higher degree of other venues like train station, bus station, fish market, gym, performing arts venue and smoke shop, to name a few. Thus, they are not well suited for opening a new restaurant. On the other hand, neighbourhoods in clusters 3 and 4 contain a much higher degree of restaurants, hotels, multiplex, cafes, bars and other food joints. Thus, the neighbourhoods in these clusters would be well suited for opening a new restaurant.

Comparing clusters 3 and 4, neighbourhoods in cluster 3 seem to be more suited for starting a restaurant since they contain a larger percentage of food joints in the top 10 most common venues than cluster 4. The neighbourhoods in cluster 3 contain a variety of food joints like restaurants, tea rooms, bakery, cafe, steakhouse and pubs and also contain very diverse cuisines like Japanese, Indian, Chinese, Italian and seafood restaurants. Most neighbourhoods in cluster 4 seem to have Indian Restaurant as their top most common venue; however, on careful analysis we can see that neighbourhoods in cluster 4 also contain other venues like soccer field, flea market, smoke shop, gym, train station, dance studio, music store, cosmetics shop and so on. Thus, it is recommended that the new restaurant can be opened in the neighbourhoods

belonging to cluster 3. This neighbourhood can be further plotted on a map as shown below in Figure 18.

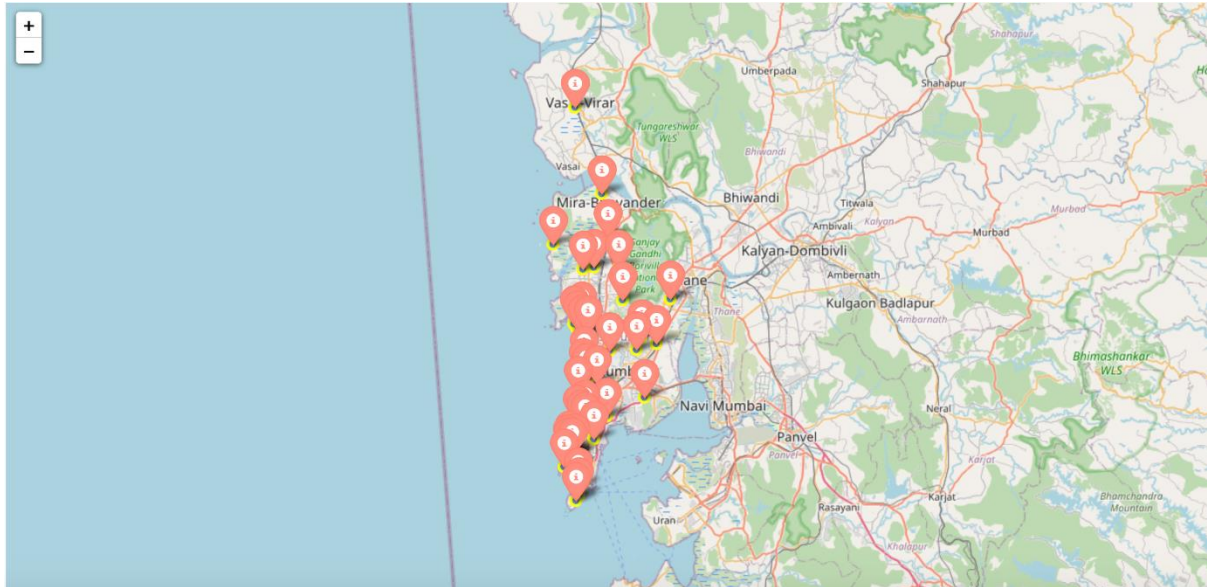

Figure 18: Neighbourhoods most suited for starting a new restaurant.

10. Conclusion

In this project, the neighbourhoods in Mumbai, India have been successfully analyzed for determining which would be the best neighbourhoods for opening a new restaurant. Based on the analysis carried out, neighborhoods in cluster 3 are recommended as locations for the new restaurant.

11. FUTURE WORK

Now we built a location analyzer system for recommending best location to open a restaurant in Mumbai city. In future we can implement for any cities or any countries, and for not only restaurants we can implement it to build a playground or for an airport , for every aspect of location analyzing we can use our location analyser system.

Some applications are:

- instead of working in just cities we can use a country's map to find a better city for factory installation by analyzing the resources available.
- Shifting offices to better locality.
- Or something related to transporting goods from one city to another.
